INTRODUCTION

Thank you for purchasing the Tekno RC NB48.3 1/8th 4WD Nitro Competition Buggy. The NB48.3 represents the state-of-the-art in 1/8th nitro buggy technology. We hope you have as much fun driving your new vehicle as we did developing it. We are always working on new projects, so please check our website (www.teknorc.com) regularly for the latest news, parts, and kits. Thanks again.

Additional equipment and parts needed:

2/3 channel surface radio transmitter and receiver
High torque steering and brake servo (at least 300 oz/in)
RX battery, switch harness
.21 nitro engine, tuned pipe, manifold, and glow plug
Fuel bottle, fuel, 1/8th buggy starter box, and glow ignitor
1/8th scale buggy tires, wheels & CA glue
Paint for body

Tools needed:

Hex drivers 1.5mm (TKR1104), 2.0mm (TKR1105), 2.5mm (TKR1106)
Nut drivers 5.0mm (TKR1107), 5.5mm (TKR1108), 7.0mm (TKR1109)
17mm Wheel Wrench (TKR1116)
Hobby knife
Needle-nose pliers
Pivot Ball and Shock Multi-tool (TKR1115, for shock assembly)
4mm turnbuckle wrench (TKR1103)
4mm arm reamer
Lexan Body Scissors

Disclaimer: Tekno RC is not responsible or liable for any property or personal damage, loss, or injury incurred as a result of using this product. This kit is meant for use by persons 14 years of age or older and in the strict confines of a legally permitted RC track or facility.

Warnings: Always double-check that your radio gear is working properly before operating vehicle. Never operate the vehicle indoors (unless the RC track is an indoor facility). Use caution while operating vehicle so as not to collide with people who may be turn marshalling or who might otherwise not be aware that a fast moving RC vehicle is in the vicinity.

Warranty: We warrant that the parts included in this kit are free from defects. If you find a defective part in your kit, please contact us @ info@teknorc.com and we will help you to resolve the issue. We do not warranty parts that may be broken during operation of the vehicle or otherwise. Refer to the end of this instruction manual for a listing of spare/replacement and option parts. All spare parts and other info are available on our website (www.teknorc.com) and through our network of domestic and international dealers and distributors.

STEP D-1

Note: The front and rear bulkheads are different. The front has a much greater output angle compared to the rear.

Note: TKR1222 and TKR1226 Shims - The gear mesh should be tight without any binding. TKR1226 should always be installed. Then test fitment of the diff with both TKR1222 shims on the gear-side of the diff. If the diff turns freely without binding, continue to next step. If the diff binds and does not turn freely (it will make a grinding or crunching sound when spun), remove one TKR1222 shim from the gear side and install it onto the other side of the diff. Reassemble and test the mesh again. If it is still binding, remove the second TKR1222 shim from the gear side and install it onto the other side of the diff. When you are satisfied that you have the best gear mesh possible continue to the next step. You may end up using only one shim on the gear side.

Changes to the wheelbase have a dramatic effect on handling, since it shifts the distribution of weight over the rear wheels. This adjusts traction. By shortening the wheelbase at the rear, you are placing more weight over the rear wheels.

Changes to the wheelbase also change the amount of sweep the rear driveshaft will have. More driveshaft sweep creates an effect similar to anti-squat, where the rear end gets pushed upwards on throttle. This helps reduce chassis slap when landing jumps on throttle.

Note: The TKR1601 set screws are meant to keep the TKR1445 screws from coming loose. After installing TKR1445 and ensuring the steering action is free, install TKR1601 in the locations indicated. Very slowly tighten the screws until you feel some resistance from contacting the TKR1445 screws. DO NOT OVERTIGHTEN. Also be sure to loosen TKR1601 before unscrewing TKR1445 or you will damage the screws and the parts.

DO NOT SKIP THIS STEP!

STEP K-2

Note: The steering stops provide adjustable travel limiters to control overall steering throw. For all but the tightest tracks, at least 4 washers should be used. With too much steering travel the rear end will lose traction coming out of corners and the vehicle will be very hard to drive. After months of testing on different track surfaces, 4 washers is the stock setting. IF THE REAR END OF YOUR VEHICLE IS LOOSE, USE MORE WASHERS.

STEP K-3

Note: The TKR1601 set screws are meant to keep the TKR1447 screws from coming loose. After installing TKR1447 and ensuring the steering action is free, install TKR1601 in the locations indicated. Very slowly tighten the screws until you feel some resistance from contacting the TKR1447 screws. DO NOT OVERTIGHTEN. Also be sure to loosen TKR1601 before unscrewing TKR1447 or you will damage the screws and the parts.

SHOCK FILLING INSTRUCTIONS

FOR BOTH FRONT AND REAR SHOCKS

The following steps and information will provide you with the best way to fill and bleed your shocks. After thorough testing, we've found it's easiest to complete steps 1 through 3 on each shock before moving onto step 4. By the time you've finished step 3 on the last shock the first one will be ready for step 4.

Standard or Vented Cap Build:

- Step 1:** Extend the shock shaft all the way down. Fill the shock with oil until it is about 90% full.
- Step 2:** Slowly pump the shock shaft up and down 3-5 times to release air bubbles from underneath the piston.
- Step 3:** Let the shock rest vertically with the shock shaft fully extended for five minutes or until all the air bubbles have released.
- Step 4:** Next you will top off the shock with oil, to about 1-2mm below the top edge.
(If you do overfill the shock, it won't hurt performance, it will just spill out and make a little bit of a mess. If you underfill the shock, it will cause air to be trapped inside.)
- Step 5:** Place the bladder *INSIDE* the shock cap and put a few drops of oil on the bladder.
- Step 6:** Put a paper towel down below the build to catch drips and have another ready to wipe off excess oil. Place the cap on the shock and screw down about half way. Lay the shock over about 45 degrees with the bleeder hole facing up.
- Step 6A: (Standard non-vented)** Push the shaft in for the amount of rebound desired.
 - Step 6B: (Vented "Stock")** Push the shaft in until about 15mm of shaft is showing.
 - Make sure that you match the rebound amount between the left and right shocks.
 - Oil should be oozing out of the bleeder hole.
- Step 7:** Hold the cap firmly in place with the bleeder hole facing up and turn the shock body until hand tight. The shock will continue to ooze oil.
- Step 8:** Fully tighten down each shock with shock tools until cap is secure and wipe excess oil away.

Emulsion Build:

Prep your shock caps TKR6018 (optional for NB48.3) accordingly by drilling out the large angled bleeder hole in the top of the cap. Place the larger thin o-ring around the base of the threads where the shock cap screws on (see diagram on the next page). This seal is crucial to the build.

Follow steps 1-4 above.

- Step 5:** Rebound is more of a natural side effect of an emulsion shock. It's not something that can be set accurately because you run the risk of hydrolocking the shock if you do not push the shaft all the way in when you bleed it. For now leave the shaft fully extended.
- Step 6:** Fill the shock up, over filling just slightly without spilling to create a small dome of oil.
- Step 7:** Place a little bit of oil in the shock cap and quickly put the shock cap on the shock body. Tighten the cap all the way down. Very slowly push the shaft in. Oil will start to bleed out of the top of the cap. While wiping away excess oil, continue to slowly push the shaft in *ALL THE WAY*. If no oil comes out when the shaft is fully inserted, you will need to start over at step 6.
- Step 8:** Install the TKR1341 M4x6mm flat head screw and TKR5125 black o-ring to seal the cap (see diagram). Tighten until o-ring is fully seated.

Note: Make sure to tighten both cartridge cap (TKR6015) and shock cap (TKR6003) to ensure a proper seal. Tools may be required.

Fill oil level just below the top of the shock body. Use #400wt oil FRONT

STEP 0-2

Note: Apply a small drop of oil for easy installation.

Note: Front shocks use shorter shock bodies - TKR6016, shorter shock shafts - TKR6017, shorter springs - TKR6048 and shorter shock boots - TKR6144

Note: Make sure to tighten both cartridge cap (TKR6015) and shock cap (TKR6003) to ensure a proper seal. Tools may be required.

STEP Q-2

Note: We recommend using a piece of thin foam or other type of padding under the battery to reduce shock. Likewise, we suggest either using a couple layers of 2-sided tape under the receiver or simply use another piece of foam and let the receiver 'float' in the box. The servo wires will help keep the receiver in place and provide shock protection.

STEP R-1

Note: Your kit contains 3 sets of clutch springs. 0.9mm (green), 1.0mm (gold), and 1.1mm (red) springs are included. The stock setting is to use (2x) 0.9mm springs on opposing shoes and then use (2x) 1.0mm springs on the other shoes. If the track is very high bite you can use (2x) 1.0mm springs and (2x) 1.1mm springs for more 'pop'. However, we strongly recommend trying the stock setting first and adjusting from there.

STEP R-2

STEP R-3

Note: Secure air filter hose with 2 zip ties (included).

Engine and Pipe Sold Separately

Note: Properly shimming the clutch bell is critical. The clutch bell must not rub on the flywheel. Depending on your particular engine, you may need to use a few of the 5x7x0.2mm shims (TKR1226) to properly space the clutch bell. The clutch bell must also move freely when the end washer and screw are fastened. There is no 'one size fits all' for the number and order of clutch bell shims that need to be used. In rare cases, the clutch bell may be too long. Simply put the clutch bell flat on a sheet of 200 grit sand paper (teeth side up) and sand about .2mm off the bottom. This should only take a minute and it will ensure that your clutch is working properly.

ENGINE / PIPE INSTALLATION

STEP S-1

VERY IMPORTANT - With the set screws that secure the pipe hanger wire set loose, install pipe onto pipe hanger wire. Adjust the wire such that the pipe and the manifold connections from the engine are not bent or angled. The pipe must fit naturally. You may need to bend the pipe hanger wire to accomplish this. Then tighten the set screw that secures the wire to the wire hanger block. The wire must then be cut flush to the wire hanger block so it will not interfere with the fuel tank. If the wire is not flush with the block, you may risk puncturing your fuel tank.

*You may need to bend the pipe wire hanger forward or backward depending on your particular pipe.
